Purpose of the "Data/Model" View in Power BI:

Data View:
Lets you **explore table data** and create **calculated columns and measures**.

Model View:
Lets you **create and manage relationships** between tables and **organize your data model**.

Slicers not affecting all visuals — Fix:

- Go to **Format > Edit interactions**, click the slicer, and **enable filtering** on all visuals.

- Make sure there's a **relationship** between the slicer's field and the visual's data.

- Check for **conflicting filters** or **disconnected tables**.

Embed Power BI in PowerPoint:

- In **Power BI Service**, click **File > Embed > PowerPoint**.

- This adds a **live, interactive report** to your slide.

- Or take a **screenshot** and paste it for a static version.
